

Oral Pathology and Surgery

There is a wide range of diseases that affect the hard and soft tissues of the head and neck region. Head and neck pathology can include both malignant and benign diseases. They can be treated surgically and non-surgically. Many of these conditions can have a significant effect on a person's wellbeing. Oral and maxillofacial surgeons are well trained in the diagnosis and treatment of oral pathology. They received specialized training to treat these lesions both surgically and with medical treatment.

Some of the most common oral surgical procedures are listed below:

- Removal of Impacted Wisdom Teeth
- Exposure of Impacted Canine
- Insertion of Dental implant
- Oral (Mouth) Biopsy
- Removal of Facial Skin Lesion
- Apicectomy
